Celloger® Series

Automated live cell imaging system

Celloger® Nano | Celloger® Mini Plus | Celloger® Pro | Celloger® Stack

Capture the moments of dynamic cellular processes, improving your research with comprehensive insights

Celloger® Line-up

Celloger® Pro

The Celloger® Pro is the most advanced and latest product in the Celloger® series. Providing researchers with state-of-the-art functionalities, it offers unmatched convenience and exceptional image quality, enhancing and expanding the scope of experiments.

Celloger® Mini Plus

The Celloger® Mini Plus is a fundamental system for live cell imaging. By offering essential and user-friendly tools for analyzing live cells, it serves as a basic system for researching dynamic cellular events, representing a model within the Celloger® series.

Celloger® Nano

The Celloger® Nano is the most compact and economical system among the Celloger® series. It can wirelessly connect to a tablet or laptop, enabling users to observe and analyze cells from anywhere. With its manual stage compatible with any vessels, it makes it easy to quickly check the state of cells.

Celloger® Stack

Celloger® Stack is an automated multi-layer vessel monitoring device, a useful system for large-scale cell cultures. By utilizing the alarm system to notify users when the optimal confluency level has been reached, it enables easy harvesting of cells at the appropriate times.

List of Awards

2023 R&D 100 WINNER · iF GOLD AWARD 2022 · iF DESIGN AWARD 2022 · reddot winner 2022 · GOOD DESIGN AWARD 2022 · GOOD DESIGN AWARD 2021 · GOOD DESIGN KOREA · FEATURED FINALIST 2022 · KOREA WORLD CLASS

Key Features of Celloger®

Pro | Mini Plus | Nano | Stack

Real-time cell monitoring inside an incubator

The Celloger® series is designed for efficiently monitoring cells in real-time without disturbing cell-growth conditions. By simply placing the devices within the incubator and connecting them to an external PC, researchers can remotely observe cells in real time.

Compatible with different vessel types

To accommodate for a wide range of experiments, different cell culture vessels such as well plates (up to 96 wells), flasks, dishes, and slides can be used by simply replacing the vessel holders for specific needs.

*Celloger® Stack is used for multi-layer vessel types.

Time-lapse imaging capability

Using the time-lapse function, cell images are captured automatically according to the schedule set by the researcher and the images are easily converted into time-lapse videos.

User-friendly functions included in the software package

The Scanning and Analysis software are included as standard packages, allowing users to create unlimited copies of both software. Researchers can easily set multiple image capture modes and generate productive experimental data using a range of analysis tools available in these software.
